Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequencing vector: M13;

```
The sequence encodes a novel human lipid metabolism enzyme (LME-2) of the invention. The invention relates to novel human LME's, and the polymucleotides which identify and encode them. The enzymes of the invention have cytostatic, neuroprotective, immunosuppressive, anti-inflammatory, and cardiovascular activity. The polypeptides and polymucleotides have a use in gene therapy and enzyme therapy. The lipid metabolism enzymes are useful in the diagnosis, treatment and prevention of cancer, neurological disorders, autoimmune/inflammatory disorders, and cardiovascular disorders, and in the assessment of the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of lipid metabolism enzymes. LMEs may also be used to screen for compounds that modulate the activity of LME. Polymucleotides encoding LME may be used for sometic or germline gene therapy, to detect and quantify gene expression in biopsied tissues in which expression of LME may be correlated with disease, to generate a transcript image of a tissue or cell type, to generate hybridization probes useful in mapping the naturally occurring genomic sequence, and for screening libraries of compounds in drug screening techniques. The polypeptide sequences may be used to analyse the proteome of a tissue or cell type. Oligonucleotide primers derived from polynucleotide sequences encoding LME may be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        360

The present sequence is the coding sequence of human phospholipase I (HPPLI): The protein produced from this sequence is involved in the hydrolysis of membrane phospholipids. The protein and its coding sequence can be used to diagnose and treat the following: cancers such as prostate, breast and testicular cancers, autoimmune and inflammatory disorders such as AIDS, allergies, anaemia, asthma, atherosclerosis, crohn's disease, diabetes mellitus, emphysema, Graves disease, irritable bowel syndrome, multiple sclerosis, myasthenia gravis, psoriasis, rheumatoid arthritis and systemic lupus erythematosus, infection caused by viruses, fungi, bacteria, parasites and protozoa, and reproductive disorders including infertility, disruptions of the menstrual cycle,
Human phospholipase genes and proteins useful to diagnose, prevent or treat cancer, autoimmune or inflammatory or reproductive disorders
                                                                                                                                                                                                                                                  Human; phospholipase 1; HPPL1; cancer; autoimmune disorder; inflammatory disorder; reproductive disorder; infection; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Baughn MR;

The invention relates to novel human proteins (NHP) and the nucleic acids that encode them and antibodies raised against them.

The proteins, antibodies and nucleic acids are useful in the diagnosis, preventions and/or treatment or diseases and/or disorders are useful in the diagnosis, prognosis, prevention, asstronfestinal disorders, cardiovascular disorders (e.g. hypertension, erectile dysfunction, high blood pressure, coronary heart diseases and arteriosclerosis), anorexia, obesity, builmia, cachexia, disorders of small intestine, disorders of reproductive system, contar intertility and/or impotence), testicular cancer, lung tumours and other hyperproliferative disorders, disorders, disorders, partension's central nervous system disorders, central nervous system disorders, central nervous system disorders, immune system disorders, central nervous system disorders, immune system disorders, learning disabilities, amount, accorders (e.g. Hashimoto's thyroiditis), renal and musculo-skeletal system disorders, central nervous system disorders (e.g. multiple sclerosis, ischemic hashimoto's thyroiditis), renal and musculo-skeletal system disorders (e.g. asthma, acquired immunodeficient syndrome (AIDS), leukasemia, rheumatoid arthritis, inflammatory bovel disease, sepsis, acne, psoriasis and lupus erythematosus), neural system ceptisis, and lupus erythematosus), neural system ceptisis, respiratory disorders, olfactory disorders and NHP of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                              New human proteins, useful for diagnosing, treating, preventing and/or prognosing disorders related to the proteins, including cardiovascular disorders, autoimmune disorders and reproductive disorders

The present invention describes human secretory phospholipase A2 (PLA2).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PLA2 has antiallergic, antiinflammatory, antibacterial, tranquillser, immunosuppressive, vulnerary, antirheumatic and antiarthritic activities. Human secretory phospholipase A2 (PLA2), the gene encoding it and antibodies against it are useful for the diagnosis and treatment of secretory PLA2-associated diseases e.g. septic shock, trauma, pancreatitis, allergic rhinitis and chronic rheumatoid arthritis. The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, adog, cat. horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a cDNA

AAH99166 to AAH99904 encode the human proteins given in AAM25225 to
AAM25966. The proteins can have activities based on the tissues and
Calls they are expressed in, such as; antiinflammatcry; antirheumatic;
calls they are expressed in, such as; antiinflammatic;
antiarthritic; immunosuppressive; antibacterial; endocrine; cardiant;
cardiovascular; antianaemic; antiagegant; haemostatic; vulnerary;
antidabetic; oxteopathic; dermatological; antiallergic; antiasthmatic;
antidabetic; cytostatic; neuroprotective; antidepressant; nootropic;
contiparkinsonian; and immunostimulaentdes are useful for screening for production, The proteins and polynucleotides are useful for screening for agonists or antagonists of a protein and for the treatment and diagnosis of disorders associated with the activity of a protein e.g. inflammation, rheumatoid arthritis, septic shock, pancreatitis, cardiac dysfunction, neuropathology, cardiac anapphylaxis, viral, bacterial, HIV and fungal infections, autolimmunity, genetic diseases, haematopoletic disorders, anaematopoletic diseases, haematopoletic disorders, anaematopoletic disorders, anaemata platelet disorders, thrombocytopaenia, wounds, burns, uncers,

The invention relates to polynucleotides encoding proteins CG122, CG179, CG CG55, CG121, CG162, CG27, CG153 and CG168 which are related to proteins involved in lipid metabolism and cardiovascular disease such as human equal protein sequences are useful for treating or preventing These DNA capolipoproteins, lipases and lipoprotein receptor proteins. These DNA capolipoproteins, lipases and lipoprotein receptor ALLr) cassociated with apolipoproteins, lipases and lipoprotein receptor (ALLr) cassociated with apolipoproteins, lipases and lipoprotein receptor (ALLr) cassociated with apolipoproteins, lipases and lipoprotein receptor (ALLr) captermining the presence of or predisposition to a disease associated determining the presence of or predisposition to a disease associated with altered levels of these sequences. ALLr polypeptides are also caseful for identifying a cherant expression or physiological interactions of this polypeptide. CC them and cells expressing ALLr proteins are useful for identifying a cherant expression or physiological interactions of this polypeptide. CC vectors comprising these DNA and protein sequences are also useful for the nucleic acids and polypeptides of the convention are also useful for the treatment of occlusive cardiovascular diseases, myocardial infarction, cerebral isofamental artery thrombosis cornary artery thrombosis and cerebral artery thrombosis of are used in gene therapy. The present sequence is human CG95 (or CB70)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acids encoding human apolipoproteins, lipases, and lipoprotein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  u P, Goodrich R;

AAS21244-AAS21518 encode for novel human secretory and transmembrane
PRO polypeptides. The PRO polypeptides are useful to detect other
PRO polypeptides, to link bloactive molecules to cells expressing
PRO polypeptides, and to detect the presence of cells expressing
DRO polypeptides, and to detect the presence of mammalian lung, colon,
breast, prostate, rectal, cervical or liver tumours by comparing PRO
DOLYPEPTIDE expression in a cell sample to that in a control sample.
Come of the 275 sequences are also useful to stimulate the release of tumour necrosis factor alpha (TNF-alpha) from human blood, the
Common or differentiation of fondrocytes, the proliferation or
Common pericyte cells, the release of proteoglycans from
Commoncytes, the proliferation of inner ear utricular supporting cells or
Commoncytes, the proliferation of endothelial cells. Some of
Commoncytes, the proliferation of endothelial cells. Some of
Commoncytes, the proliferation of endothelial cells. Some of
Commoncytes, the PRO polypeptides can be used in assays to identify
Complemental muscle cells or by adipocytes; or inhibit binding of A-peptide
Complemental muscle cells or by adipocytes; or inhibit binding of A-peptide
Complemental muscle cells or by adipocytes; or inhibit binding of A-peptide
Complemental muscle cells or by adipocytes; or inhibit binding of A-peptide
Complemental muscle cells or by adipocytes; or inhibit binding of A-peptide
Complemental muscle cells or by adipocytes; or inhibit binding of A-peptide
Complemental or knock out animals and can be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gao W;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated, secretory and transmembrane PRO polypeptide used to detect other PRO polypeptides, link bioactive molecules to cells expressing PRO polypeptides, and detect the presence of mammalian tumours e.g. lung, breast, prostate, cervical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Deforge L, Desnoyers L, Filvaroff E, Ge

Secreted and transmembrane proteins and nucleic acids designated PRO, useful as hybridization probes, in chromosome and gene mapping and gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Baker KP, Botstein D, Desnoyers L, Eaton DL, Ferrara N, Fong S; Gao W, Goddard A, Godowski PJ, Grimaldi CJ, Gurney AL, Hillan KJ; Pan J, Paoni NF, Roy MA, Smith V, Stewart TA, Tumas D; Watanabe CK, Williams PM, Wood WI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.

AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences conciding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
                                                                                                                                                                                                                                                                                                                                              New mammalian DNA sequences encoding transmembrane, receptor or secreted PRO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions

A partial human genomic counterpart to RPLA2-8, HPLA2-8 (AAQ81139), was also obtained. RPLA2-8 and HPLA2-8 have been designated type III PLA2, and RPLA2-10

A human PLA2-encoding cDNA (AAQ81138) expressing HPLA2-10, was isolated from human brain RNA by RACE-PCR. 2 Rat PLA2 CDNAS, designated RPLA2-8 (AAQ81136) and RPLA2-10 (AAQ81137), were isolated from rat brain and heart cDNA libraries, respectively. A partial human genomic counterpart to RPLA2-8, HPLA2-8 (AAQ81139), was also obtained. RPLA2-8 and HPLA2-8 and RPLA2-9 and RPLA2-10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          181 GACTGGTGCTGCCACGCCCACGACTGCTGCTACCAGGAACTCTTTGACCAAGGCTGTCAC 240

The full length cDNA was generated using primers AAA72082-A72088 in the invention relates to the novel secreted retain phospholipase A2 activity. It also encompasses an expression retain phospholipase A2 activity. It also encompasses an expression method for the recombinant production of the protein, a method of screening potential inhibitors of the protein, a method of screening potential inhibitors of the protein, a method of a screening potential inhibitors of the protein and the compounds thus used for the diagnosis of a variety of diseases.

The present invention describes human secretory phospholipase A2 (PLA2). PLA2 has antiallergic, antinflammatory, antibacterial, tranquillser, immunosuppressive, vulnerary, antirheumatic and antiarthritic activities. Human secretory phospholipase A2 (PLA2), the gene encoding it and antibodies against it are useful for the diagnosis and treatment pancreatitis, placypactated diseases e.g. septic shock, trauma, pancreatitis, allergic rhinitis and chronic rheumatoid arthritis. The present sequence encodes mouse PLA2, which is used in an example from
                                                                                                                                                                                      Mouse secretory phospholipase A2 nucleotide sequence SEQ ID NO:13.
                                                                                                                                                                                                                                                 Secretory phospholipase A2; PLA2; antiallergic; antiinflammatory;

Patent No. US20020151681A1
GENERAL INFORMATION:
APPLICANT: Craig Rosen,
TITLE OF INTENTION: Nucleic Acids, Proteins and Antibodies
TITLE OF INTENTION: Nucleic Acids, Proteins and Antibodies
CURRENT APPLICATION NUMBER: US/09/925,300
FILE REPERENCE: PAIO1
CURRENT FILING DATE: 2000-03-08
PRIOR FILING DATE: 2000-03-08
PRIOR FILING DATE: 1999-03-12
PRIOR FILING DATE: 1999-03-12
MINNER OF SEA IN NACE 1000
